Next Item

1/1 point

Suppose your training examples are sentences (sequences of words). Which of the following refers to the  $j^{th}$  word in the  $i^{th}$ training example?

 $x^{(i) < j >}$ 

We index into the  $i^{th}$  row first to get the  $i^{th}$  training example (represented by parentheses), then the  $j^{th}$  column to get the  $j^{th}$  word (represented by the brackets).

- $x^{< i > (j)}$
- $x^{(j) < i >}$
- $x^{< j > (i)}$

1/1 point

2.

Consider this RNN:

This specific type of architecture is appropriate when:

$$T_x = T_u$$

It is appropriate when every input should be matched to an output.

- - $T_x < T_y$
- - $T_x > T_y$
- $T_x = 1$

3.

To which of these tasks would you apply a many-to-one RNN architecture? (Check all that apply).

Speech recognition (input an audio clip and output a transcript)

**Un-selected is correct** 

Sentiment classification (input a piece of text and output a 0/1 to denote positive or negative sentiment)

Correct

Correct!

Image classification (input an image and output a label)

**Un-selected is correct** 

Gender recognition from speech (input an audio clip and output a label indicating the speaker's gender)

Correct

Correct!

4

You are training this RNN language model.

At the  $t^{th}$  time step, what is the RNN doing? Choose the best answer.

- $\qquad \qquad \mathsf{Estimating}\ P(y^{<1>},y^{<2>},\dots,y^{< t-1>})$
- Stimating  $P(y^{< t>})$
- Consisting  $P(y^{< t>} \mid y^{< 1>}, y^{< 2>}, \ldots, y^{< t-1>})$

Correct

	Yes,	in	a
_	R	e	C

es, in a language model we try to predict the next step based on the knowledge of all prior steps.

5.

You have finished training a language model RNN and are using it to sample random sentences, as follows:

What are you doing at each time step t?

- (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as  $\hat{y}^{< t>}$ . (ii) Then pass the ground-truth word from the training set to the next time-step.
- (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as  $\hat{y}^{< t>}$ . (ii) Then pass the ground-truth word from the training set to the next time-step.
- (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as  $\hat{y}^{< t>}$ . (ii) Then pass this selected word to the next time-step.
- (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as  $\hat{y}^{< t>}$ . (ii) Then pass this selected word to the next time-step.

#### Correct

Yes!

1/1 point

6.

You are training an RNN, and find that your weights and activations are all taking on the value of NaN ("Not a Number"). Which of these is the most likely cause of this problem?

- Vanishing gradient problem.
- Exploding gradient problem.

## Correct

- ReLU activation function g(.) used to compute g(z), where z is too large.
- Sigmoid activation function g(.) used to compute g(z), where z is too large.

Quiz, 10 questions

100

Suppose you are training a LSTM. You have a 10000 word vocabulary, and are using an LSTM with 100- $x \le t > W$ but in the disconsist of $\Gamma$ of each time at $x \ge t$	dimensional activations
$a^{< t>}$ . What is the dimension of $\Gamma_u$ at each time step?	
O 1	

### Correct

Correct,  $\Gamma_u$  is a vector of dimension equal to the number of hidden units in the LSTM.

300

1/1 point

Here're the update equations for the GRU.

Alice proposes to simplify the GRU by always removing the  $\Gamma_u$ . I.e., setting  $\Gamma_u$  = 1. Betty proposes to simplify the GRU by removing the  $\Gamma_r$ . I. e., setting  $\Gamma_r$  = 1 always. Which of these models is more likely to work without vanishing gradient problems even when trained on very long input sequences?

Alice's model (removing $\Gamma_u$ ), because if $\Gamma_rpprox 0$ for a timestep, the gradient can propagate back through that timestep
without much decay.

Alice's model (removing  $\Gamma_u$ ), because if  $\Gamma_r pprox 1$  for a timestep, the gradient can propagate back through that timestep without much decay.

Betty's model (removing  $\Gamma_r$ ), because if  $\Gamma_u pprox 0$  for a timestep, the gradient can propagate back through that timestep without much decay.

#### Correct

Yes. For the signal to backpropagate without vanishing, we need  $c^{< t>}$  to be highly dependant on  $c^{< t-1>}$ .

Betty's model (removing  $\Gamma_r$ ), because if  $\Gamma_u \approx 1$  for a timestep, the gradient can propagate back through that timestep without much decay.

9.

Here are the equations for the GRU and the LSTM:

## Recurrent Neural Networks

Quiz, 10 questions

From these, we can see that the Update Gate and Forget Gate in the LSTM play a role similar to \_\_\_\_\_ and \_\_\_\_ in the GRU. What should go in the the blanks?

 $\Gamma_u$  and  $1-\Gamma_u$ 

#### Correct

Yes, correct!

 $\bigcap$   $\Gamma_u$  and  $\Gamma_r$ 

 $\bigcap$   $1-\Gamma_u$  and  $\Gamma_u$ 

 $\bigcap$   $\Gamma_r$  and  $\Gamma_u$

10.

You have a pet dog whose mood is heavily dependent on the current and past few days' weather. You've collected data for the past 365 days on the weather, which you represent as a sequence as  $x^{<1>},\dots,x^{<365>}$ . You've also collected data on your dog's mood, which you represent as  $y^{<1>},\dots,y^{<365>}$ . You'd like to build a model to map from  $x\to y$ . Should you use a Unidirectional RNN or Bidirectional RNN for this problem?

- Bidirectional RNN, because this allows the prediction of mood on day t to take into account more information.
- Bidirectional RNN, because this allows backpropagation to compute more accurate gradients.
- Unidirectional RNN, because the value of  $y^{< t>}$  depends only on  $x^{< 1>}, \dots, x^{< t>}$  , but not on  $x^{< t+1>}, \dots, x^{< 365>}$

## Correct

Yes!

Unidirectional RNN, because the value of  $y^{< t>}$  depends only on  $x^{< t>}$ , and not other days' weather.
